

Difference between HTTP and HTTPS:

HTTP

- HTTP is used to transfer data between a web browser and a website server.
- It is not secure because data is sent in plain text.
- Hackers can easily read or steal information during transmission.
- Website URLs start with http://.
- No encryption is used to protect data.
- It is suitable only for websites where security is not important.

HTTPS

- HTTPS is used to transfer data securely between a web browser and a website server.
- It is secure because data is encrypted before being sent.
- Hackers cannot easily read or steal information during transmission.
- Website URLs start with https://.
- Encryption (SSL/TLS certificates) is used to protect data.
- It is commonly used for banking, online shopping, login pages, and secure websites.
